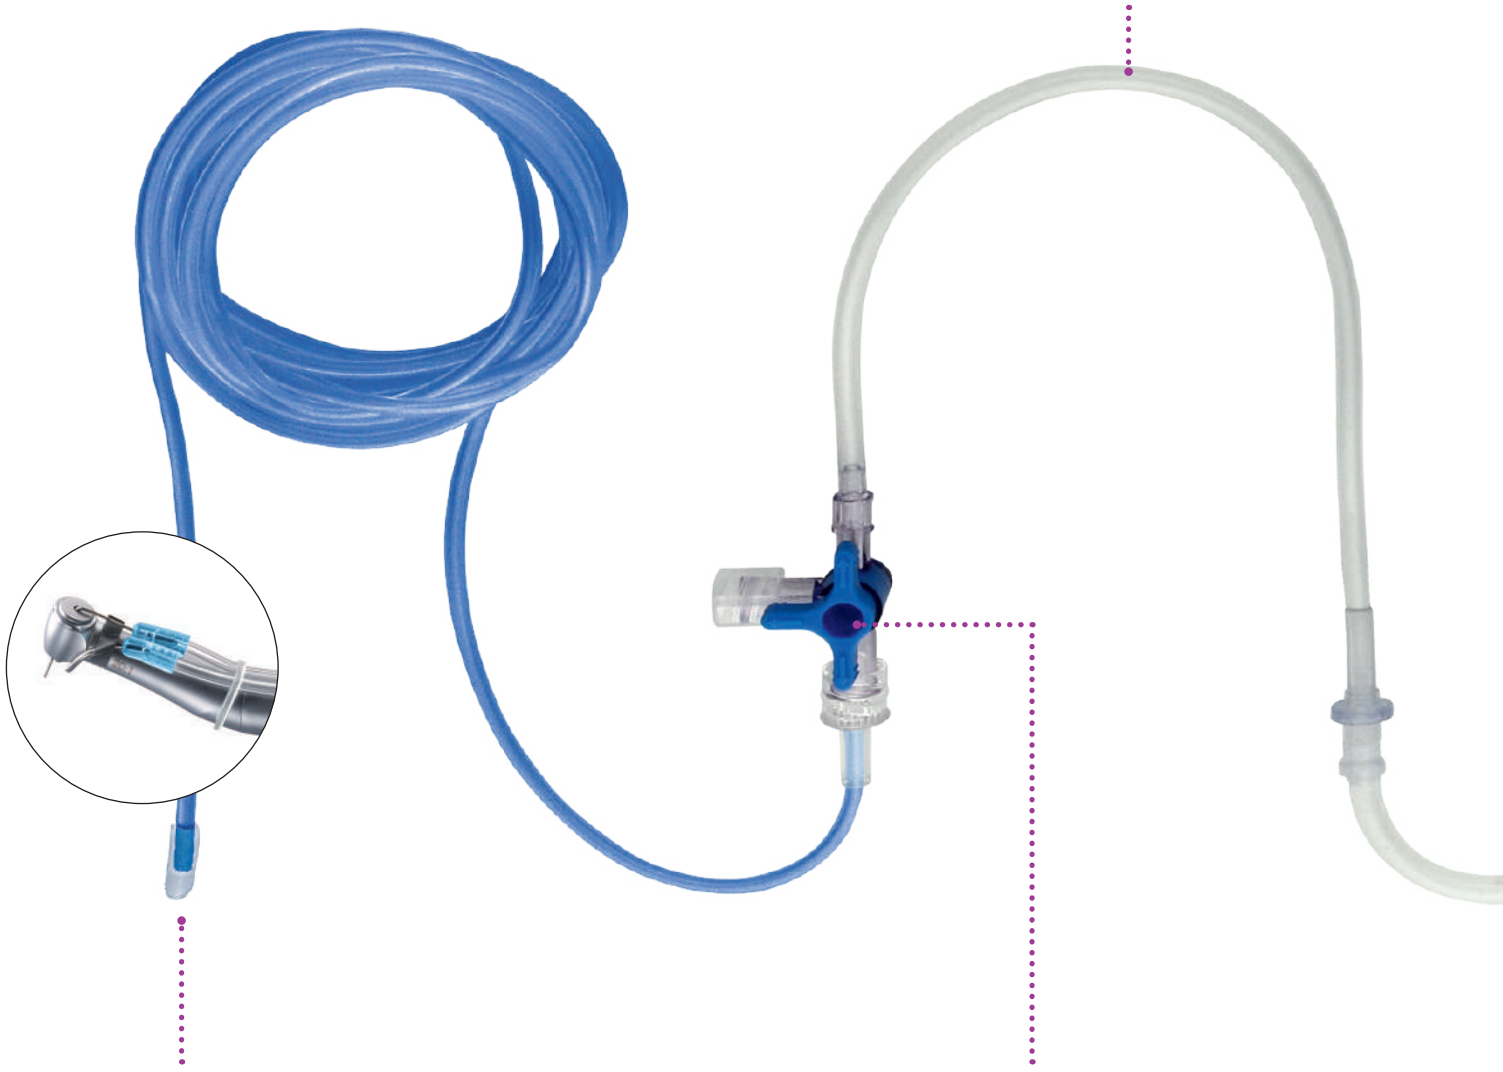
Caratteristiche delle linee di irrigazione

Features of irrigation lines

TUBO FLESSIBILE
Il tubo flessibile della linea di irrigazione è prodotto a sezione costante, realizzato per l'uso in campo medico e con caratteristiche di elasticità, alta flessibilità e trasparenza, in modo da rendere immediatamente osservabile l'eventuale passaggio di bolle d'aria. Il tubo flessibile ha una lunghezza di 230 cm e un diametro di 1,5 x 3 mm.

HOSE
The hose of the irrigation line is produced in one piece, intended to be used in medical field with characteristics of elasticity, high flexibility and transparency, so that the eventual passage of air bubbles in the water can be clearly observed. The hose is 230 cm long and its diameter is 1,5x3 mm.



PUNTALINO FINALE
Viene inserito nella parte terminale del deflussore, un pratico puntalino che agevola il raccordo della linea di irrigazione sul manipolo, permettendo di raccordare i deflussori con tutti gli aghi per raffreddamento dei vari manipoli, i cui diametri spesso differiscono gli uni dagli altri.

END TIP
The tip is inserted in the final part of the physiodispenser and it comes with a practical cap which helps the connection of the irrigation line on the hand piece. This allows to connect the irrigation lines with all cooling needles, often having different diameters.

RUBINETTO
Il rubinetto a 3 vie serve per regolare il flusso del liquido e permetterne un controllo ottimale. Il rubinetto è presente solo nei set di irrigazione cod. REF. 32.F0139, 32.F0015, 32.F0159 e 32.F0171.

TAP
The 3-way stopcock tap, is used to regulate the flow, and allows to have optimal control on the flow of the liquid. The tap is included only in irrigation sets REF. 32.F0139, 32.F0159 and 32.F0171.

COMPONENTI PER SEMPLIFICARE LA ROUTINE.

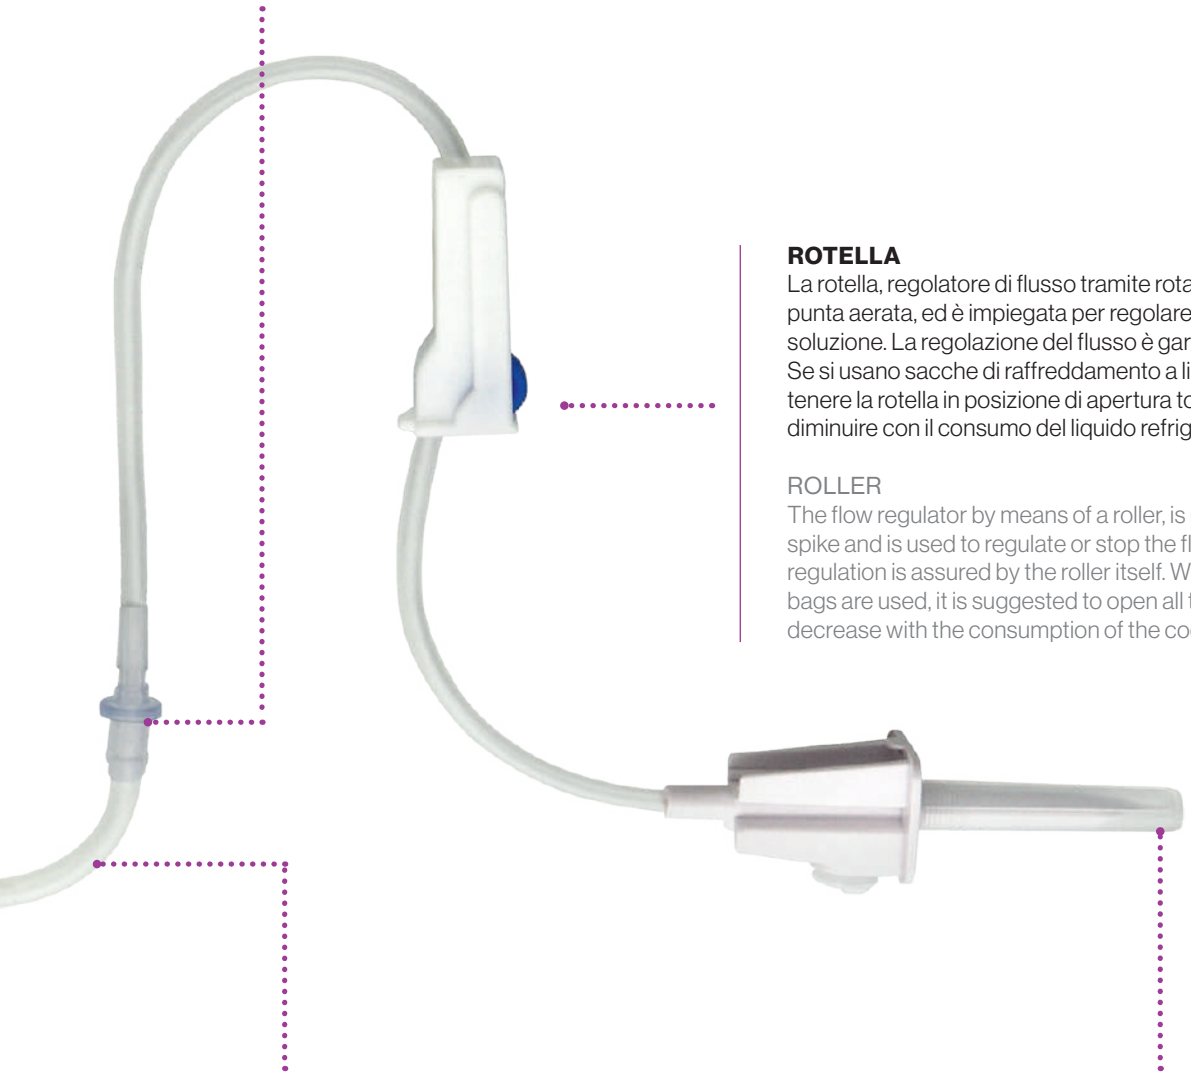
COMPONENTS TO SIMPLIFY YOUR ROUTINE.

RACCORDO

Le linee di irrigazione sono dotate di un particolare raccordo, posto dopo la porzione di pompa peristaltica. Il raccordo in resina acetalica agisce da riduzione tra la porzione di pompa peristaltica e il tubo flessibile di irrigazione, di diametro minore. Il suo compito è prevenire eventuali perdite d'acqua.

CONNECTOR

Irrigation lines present a particular connector, placed after the peristaltic pump section. The connector in acetal resin acts as a reduction between the peristaltic pump section and the irrigation hose, of smaller diameter. The aim is to prevent any possible leak of water.



ROTELLA

La rotella, regolatore di flusso tramite rotazione, viene montata dopo la punta aerata, ed è impiegata per regolare o interrompere il flusso della soluzione. La regolazione del flusso è garantita dalla rotella stessa.
Se si usano sacche di raffreddamento a liquido da ½ litro, si consiglia di tenere la rotella in posizione di apertura totale, poiché il flusso tende a diminuire con il consumo del liquido refrigerante.

ROLLER

The flow regulator by means of a roller, is mounted after the vented spike and is used to regulate or stop the flow of the solution. The flow regulation is assured by the roller itself. When ½ litre sterile liquid cooling bags are used, it is suggested to open all the roller as the flow tends to decrease with the consumption of the coolant liquid.

SEZIONE TUBO POMPA PERISTALTICA

La sezione di tubo della pompa peristaltica è in silicone morbido e consente di ottenere un flusso preciso e una lunga durata. La lunghezza della sezione della pompa peristaltica varia a seconda del physiodispenser, per adattare ogni linea di irrigazione alle diverse pompe peristaltiche sul mercato.

PERISTALTIC PUMP HOSE SECTION

The peristaltic pump hose section is made of soft silicone and allows an accurate flow and long duration of usage.The length of the peristaltic pump section varies according to the different physiodispensers, to adapt each irrigation line to the different peristaltic pumps available on the market.

PERFORATORE

La parte iniziale della linea di irrigazione è il perforatore.
Il perforatore, idoneo a perforare il tappo della sacca di fisiologica, è fornito con filtro d'aria, che è costituito da un tappo "apri e chiudi" allo scopo di compensare la pressione interna della sacca/ bottiglia.

VENTED SPIKE

The first part of the irrigation line is the vented spike. It is suitable to punch the cap of the coolant liquid, is supplied with an air filter, which looks like a cap to be opened and closed in order to offset the internal pressure of the bag/bottle.
